MEMORANDUM FOR RECORD

SUBJECT: Environmental Management System (EMS) Policy

Environmental Management System (EMS) Policy

Letterkenny Army Depot (LEAD), through its commitment to the defense of the nation, is committed to protection of the environment, including pollution prevention, environmental compliance, and a philosophy of continual improvement of the EMS to enhance environmental performance.

LEAD is the premier DOD center of industrial and technical excellence for air defense, hypersonics, directed energy, tactical missile ground support equipment, mobile electric power generation equipment, Patriot missile recertification, and Route Clearance vehicles. To ensure the environmental compliance of these programs, LEAD has established an Environmental Management System (EMS) that identifies, monitors, and mitigates environmental impacts from its various operations.

The EMS sets and monitors clearly defined environmental objectives that measure our commitment and progress toward exceeding environmental compliance. The EMS, to include objectives, is reviewed by the Environmental Quality Control Committee (EQCC) on a periodic basis to ensure pollution prevention, waste and energy consumption reduction, and protection of natural and cultural resources. This periodic review also helps to ensure continued improvement of the overall EMS.

To meet our moral, legal and other responsibilities, the EQCC monitors updates to environmental policies and regulations to maintain environmental compliance and ensure continued compliance into the foreseeable future.
